Abstract

Background: Value-Based Leadership in Community-Oriented Social Enterprises has practical relevance for community-facing organizations because visible activity does not necessarily translate into durable organizational or stakeholder outcomes. In community-oriented social enterprises, managers must coordinate values, priorities, decision rights, resource allocation, communication, and accountability while responding to expectations from leaders, managers, employees, community representatives, and organizational partners. A program may expand reach or participation and still underperform when responsibilities are unclear, information is fragmented, or values that are not reflected in decisions.

Aims: This article develops a capability-based framework explaining how value-based leadership may contribute to trust, decision quality, and alignment. It distinguishes simple activity from coordinated capability and identifies boundary conditions that can weaken otherwise positive relationships.

Research Method: The paper uses an integrative conceptual review of established literature relevant to the focal domain, organizational capabilities, stakeholder relationships, and learning. It does not claim primary survey, interview, experimental, or transaction data.

Results and Conclusion: The synthesis identifies four mutually dependent mechanisms: values-to-decision consistency, participative sensemaking, capability-enabling leadership, and accountability and learning. Their value depends on transparent governance, usable information, proportionate participation requirements, and a review process that converts exceptions into improvement. The article argues that higher activity alone is an inadequate indicator of success because benefits can coexist with hidden workload, exclusion, dependency, or weakened trust.

Contribution: The article contributes a diagnostic framework, linked performance indicators, six propositions for empirical testing, and a five-stage implementation pathway that can be used in resource-constrained community organizations.

Keywords: leadership; value-based leadership; community development; trust

1. INTRODUCTION

Value-Based Leadership in Community-Oriented Social Enterprises addresses a problem that is easy to describe but harder to manage in everyday organizational life. In community-oriented social enterprises, value-based leadership is often discussed through visible programs, targets, or communication activities. Those elements matter, yet they do not by themselves explain whether the organization can produce reliable value for the people it serves. The practical test appears in ordinary moments such as resource trade-offs, community consultations, and performance conversations. When information, responsibility, and follow-up are aligned, these moments can strengthen trust and decision quality. When they are not, the same initiative may add work without resolving the original problem. This capability-oriented view is consistent with research that distinguishes resources from the routines through which resources are actually used (Freeman, 1984; Meyer & Allen, 1991).

The issue is particularly important for community-facing organizations because performance is rarely judged by a single stakeholder or a single metric. Managers may be concerned with cost, continuity, and operational discipline, while customers, members, employees, suppliers, or community partners pay attention to access, fairness, service quality, voice, and the credibility of promises. These perspectives do not always conflict, but they can expose trade-offs that disappear in aggregate reporting. A program that increases reach, for example, can still weaken confidence if it also creates selective consultation. Similarly, efficiency gains can be short-lived when they depend on hidden work, fragile partner relationships, or knowledge held by one person. The analytical task is therefore to connect organizational outcomes with the conditions under which they are produced.

This article asks how value-based leadership can contribute to trust, decision quality, alignment in community-oriented social enterprises, and which conditions make that relationship more or less credible. It uses an integrative conceptual review that combines established research streams without claiming primary survey, interview, experimental, or transaction data. The contribution is deliberately practical as well as conceptual. The article separates the focal construct from simple activity counts, identifies four operating mechanisms, proposes linked indicators, and develops six propositions for later empirical testing. The intention is not to present publication, adoption, or participation as evidence of success. Instead, the framework focuses on traceable routines, boundary conditions, and decisions that can be examined by future researchers and by managers responsible for implementation.

2. CONCEPTUAL FOUNDATION

2.1 Values-to-decision consistency

Values-to-decision consistency is treated here as an organizational capability rather than a label for a single initiative. It concerns the ability to connect stated values with visible choices about people, resources, and stakeholders. That distinction is important in community-oriented social enterprises, where decisions about values, priorities, decision rights, resource allocation, communication, and accountability are distributed across leaders, managers, employees, community representatives, and organizational partners. A process may look adequate on paper while still breaking down at the handoff between delegation decisions and performance conversations; the weakness only becomes visible when the complete sequence is followed. The literature on capabilities and stakeholder relationships suggests that durable results depend on routines that can be repeated, reviewed, and adjusted, not on isolated activities (Eisenhardt & Martin, 2000; Boxall & Purcell, 2016). For this reason, the leading evidence is not simply whether the practice exists, but whether decision-value alignment can be observed consistently and whether it contributes to organizational legitimacy without undermining decision quality. A boundary condition is values used only as slogans. If that condition persists, more activity can create the appearance of progress while leaving the underlying relationship or operating problem unchanged.

2.2 Participative sensemaking

Participative sensemaking is treated here as an organizational capability rather than a label for a single initiative. It concerns the ability to bring operational and community knowledge into important decisions without avoiding managerial responsibility. That distinction is important in community-oriented social enterprises, where decisions about values, priorities, decision rights, resource allocation, communication, and accountability are distributed across leaders, managers, employees, community representatives, and organizational partners. A process may look adequate on paper while still breaking down at the handoff between delegation decisions and handling of difficult feedback; the weakness only becomes visible when the complete sequence is followed. The literature on capabilities and stakeholder relationships suggests that durable results depend on routines that can be repeated, reviewed, and adjusted, not on isolated activities (Collings & Mellahi, 2009; Sen, 1999). For this reason, the leading evidence is not simply whether the practice exists, but whether quality of participation can be observed consistently and whether it contributes to employee commitment without undermining alignment. A boundary condition is consultation without influence. If that condition persists, more activity can create the appearance of progress while leaving the underlying relationship or operating problem unchanged.

2.3 Capability-enabling leadership

Capability-enabling leadership is treated here as an organizational capability rather than a label for a single initiative. It concerns the ability to delegate with support, feedback, and clear boundaries so capability grows beyond individual leaders. That distinction is important in community-oriented social enterprises, where decisions about values, priorities, decision rights, resource allocation, communication, and accountability are distributed across leaders, managers, employees, community representatives, and organizational partners. A process may look adequate on paper while still breaking down at the handoff between performance conversations and delegation decisions; the weakness only becomes visible when the complete sequence is followed. The literature on capabilities and stakeholder relationships suggests that durable results depend on routines that can be repeated, reviewed, and adjusted, not on isolated activities (Deming, 1986; Bass & Riggio, 2006). For this reason, the leading evidence is not simply whether the practice exists, but whether delegated decision competence can be observed consistently and whether it contributes to employee commitment without undermining trust. A boundary condition is leader bottlenecks. If that condition persists, more activity can create the appearance of progress while leaving the underlying relationship or operating problem unchanged.

Concept	Diagnostic question	Illustrative evidence
Values-to-decision consistency	Is decision-value alignment visible and reliable?	decision-value alignment; credibility and trust
Participative sensemaking	Is quality of participation visible and reliable?	quality of participation; better-informed decisions
Capability-enabling leadership	Is delegated decision competence visible and reliable?	delegated decision competence; organizational depth
Accountability and learning	Is follow-up completion visible and reliable?	follow-up completion; adaptation and legitimacy

Table 1. Diagnostic distinction between activity and coordinated capability.

Taken together, these distinctions keep the analysis focused on how the strategy works rather than on whether it is merely present. For managers, the value of the framework is diagnostic: a weak outcome can be traced back to a specific handoff, information problem, capability gap, or governance condition. For researchers, the same separation reduces the risk of treating adoption, participation, or communication volume as a substitute for the capability itself.

3. REVIEW APPROACH

The manuscript uses an integrative conceptual review. The objective is theory building and managerial clarification rather than estimation of an average causal effect. Sources are used to clarify the meaning of value-based leadership, explain mechanisms that may connect it with trust and decision quality, and identify conditions under which the expected relationship may weaken or reverse. The review therefore combines foundational work with later studies that have shaped discussion of capability, stakeholder relationships, organizational learning, and the primary domain of the article. It does not report a database search count or effect size because those procedures were not undertaken.

The synthesis was organized around five questions. First, what distinguishes the focal capability from the mere presence of a program or tool? Second, which routines influence decisions about values, priorities, decision rights, resource allocation, communication, and accountability? Third, how do leaders, managers, employees, community representatives, and organizational partners experience the handoffs among those routines? Fourth, which indicators can show progress before final outcomes appear? Fifth, what risks could make a seemingly positive intervention produce exclusion, dependency, or hidden cost shifting? These questions keep the review close to observable organizational practice while remaining consistent with the theoretical concern that capabilities are built through coordinated action and learning (March, 1991; Collings & Mellahi, 2009).

3.1 Analytical procedure

Step	Purpose	Output used in this article
1. Construct separation	Separate visible activity from the underlying capability	Definitions and diagnostic questions
2. Mechanism coding	Identify how value may be produced in recurring work	Four operating mechanisms
3. Dual-outcome mapping	Connect organizational outcomes with stakeholder or community effects	Linked scorecard
4. Boundary analysis	Identify conditions that can weaken or reverse benefits	Risks and six propositions

Table 2. Conceptual synthesis procedure.

3.2 Unit of analysis and boundaries

The unit of analysis is a community-facing organizational system rather than an isolated department. Depending on the title, that system may include a cooperative, social enterprise, foundation, local supplier network, community program, or a set of partners serving the same group. 'Community' should be defined operationally in later empirical work - for example by membership, service area, municipality, producer network, or beneficiary group - rather than assumed from branding. The framework does not require every actor to be locally owned. External technology providers, universities, financial institutions, or specialist partners can add value when their role strengthens local capability and preserves reasonable options for participation and exit.

3.3 Validity and responsible use

Validity in a conceptual article depends on disciplined claims. The framework is therefore presented as a set of propositions and measurement suggestions, not as proof that value-based leadership has already caused the outcomes described. Future studies should specify baselines, comparison periods, contextual changes, and the level at which outcomes are measured. Qualitative evidence is also important because transaction or administrative data can miss informal work, perceived unfairness, exclusion, or changes in bargaining power. Where the final article is developed further, all affiliations, correspondence details, authorship, references, and disclosure requirements should be verified by the named contributors before submission.

3.4 Review implication

The review design deliberately keeps claims close to observable practice. The framework can guide a pilot, interview protocol, case comparison, or survey instrument, but it should not be interpreted as evidence that the proposed relationships already hold in every setting. The next research step is to translate each mechanism into measures that fit the organizational context, then examine whether changes are sustained across more than one operating cycle.

4. AN INTEGRATED CAPABILITY FRAMEWORK

The proposed framework begins with enabling conditions, moves through four operating mechanisms, and ends with linked organizational and community outcomes. The mechanisms are values-to-decision consistency, participative sensemaking, capability-enabling leadership, accountability and learning. They are separated analytically because an organization can be strong in one and weak in another. A convincing strategy requires the connections among them to work well enough that improvements in one area do not simply transfer cost or risk elsewhere. Governance - especially role clarity, transparent rules, proportionate information access, grievance handling, and the ability to revise a weak arrangement - affects every connection. This structure follows the broader logic of dynamic capabilities and stakeholder management: resources create value when organizations can sense relevant problems, coordinate action, and reconfigure routines as evidence changes (ILO, 2013; Gronroos, 1984).

ENABLING CONDITIONS	OPERATING MECHANISMS	OUTCOMES
Clear problem definition; usable information; staff and partner capability; proportionate resources; agreed rules	1. Values-to-decision consistency 2. Participative sensemaking 3. Capability-enabling leadership 4. Accountability and learning	Organizational: trust, decision quality, alignment Stakeholder/community: employee commitment, stakeholder confidence, organizational legitimacy
GOVERNANCE CONDITIONS	Transparent terms; accountable roles; data and privacy controls; grievance and review routes	BOUNDARY RISKS: values that are not reflected in decisions; centralized authority; selective consultation; inconsistent accountability

Figure 1. Capability-mechanism-outcome framework proposed by this article.

4.1 Values-to-decision consistency

The operational value of values-to-decision consistency becomes visible when it is connected with recurring cases such as resource trade-offs, delegation decisions, and the exceptions that follow them. Managers need enough structure to make responsibilities clear, but not so much procedure that frontline judgment becomes impossible. In a community setting, the same rule can affect groups differently, so reviews should ask who can participate, who carries the cost of compliance, and who receives useful information. A practical indicator is decision-value alignment; it gives an early signal before broader outcomes such as stakeholder confidence or decision quality become visible. Where the indicator deteriorates, the first response should be diagnosis rather than expansion. Common explanations include centralized authority, unclear ownership, or a mismatch between formal requirements and available capability. This diagnostic use of evidence is consistent with the wider argument that learning and adaptation are central to sustained performance (Sen, 1999).

4.2 Participative sensemaking

The operational value of participative sensemaking becomes visible when it is connected with recurring cases such as performance conversations, strategy meetings, and the exceptions that follow them. Managers need enough structure to make responsibilities clear, but not so much procedure that frontline judgment becomes impossible. In a community setting, the same rule can affect groups differently, so reviews should ask who can participate, who carries the cost of compliance, and who receives useful information. A practical indicator is quality of participation; it gives an early signal before broader outcomes such as employee commitment or decision quality become visible. Where the indicator deteriorates, the first response should be diagnosis rather than expansion. Common explanations include symbolic communication, unclear ownership, or a mismatch between formal requirements and available capability. This diagnostic use of evidence is consistent with the wider argument that learning and adaptation are central to sustained performance (Meyer & Allen, 1991).

4.5 Governance conditions

Governance connects the four mechanisms. Clear roles, understandable terms, proportionate information access, and a credible route for questions or grievances make it easier to identify where responsibility sits when a process fails. Governance is especially important in community-oriented social enterprises because organizations often depend on partners or community actors who do not control the overall system. A workable design therefore makes escalation, review, correction, and exit visible before problems become disputes.

4.3 Capability-enabling leadership

The operational value of capability-enabling leadership becomes visible when it is connected with recurring cases such as delegation decisions, resource trade-offs, and the exceptions that follow them. Managers need enough structure to make responsibilities clear, but not so much procedure that frontline judgment becomes impossible. In a community setting, the same rule can affect groups differently, so reviews should ask who can participate, who carries the cost of compliance, and who receives useful information. A practical indicator is delegated decision competence; it gives an early signal before broader outcomes such as stakeholder confidence or employee commitment become visible. Where the indicator deteriorates, the first response should be diagnosis rather than expansion. Common explanations include leader dependence, unclear ownership, or a mismatch between formal requirements and available capability. This diagnostic use of evidence is consistent with the wider argument that learning and adaptation are central to sustained performance (World Bank, 2022).

4.4 Accountability and learning

The operational value of accountability and learning becomes visible when it is connected with recurring cases such as strategy meetings, resource trade-offs, and the exceptions that follow them. Managers need enough structure to make responsibilities clear, but not so much procedure that frontline judgment becomes impossible. In a community setting, the same rule can affect groups differently, so reviews should ask who can participate, who carries the cost of compliance, and who receives useful information. A practical indicator is follow-up completion; it gives an early signal before broader outcomes such as stakeholder confidence or employee commitment become visible. Where the indicator deteriorates, the first response should be diagnosis rather than expansion. Common explanations include values that are not reflected in decisions, unclear ownership, or a mismatch between formal requirements and available capability. This diagnostic use of evidence is consistent with the wider argument that learning and adaptation are central to sustained performance (ILO, 2013).

5. VALUES, DECISION QUALITY, AND STAKEHOLDER CONFIDENCE

5.1 Participation and access

A community-oriented application should be evaluated through participation as well as output. In community-oriented social enterprises, the people most affected by a decision may not have the same time, information, confidence, or bargaining power. A process that works smoothly for experienced users can be difficult for a new member, a small supplier, a volunteer, or an enterprise with limited digital capability. For that reason, managers should examine who can complete handling of difficult feedback or delegation decisions without informal assistance, who drops out, and which requirements create unnecessary barriers. Inclusion does not mean lowering legitimate quality, safety, or financial standards. It means making expectations understandable, proportionate, and accompanied by a feasible route to compliance.

5.2 Trust, response, and capability

Trust is built through accumulated evidence rather than a single message. Stakeholders compare what the organization says with what happens when something goes wrong. Community consultations is especially revealing because it tests whether responsibilities remain clear under pressure. A credible response acknowledges the issue, explains the next step, assigns ownership, and returns with an outcome or a reasoned revision. Repeated silence, unexplained exceptions, or centralized authority can outweigh the effect of positive communication. Relationship research therefore treats trust as an outcome of reliable exchanges and perceived integrity, not simply familiarity (Gronroos, 1984).

5.3 Capability accumulation and value distribution

Capability accumulation is another important boundary. An intervention can raise short-term activity while leaving local actors dependent on an external operator, consultant, platform, or unusually capable employee. A stronger design uses recurring work such as performance conversations to build transferable knowledge. People should gradually be able to execute the task, interpret exceptions, and improve the process without continuous rescue. This is where organizational learning becomes visible: lessons are retained in routines, decision rules, documentation, and shared understanding rather than disappearing when a project ends or staff change (ILO, 2013; Sen, 1999). Finally, value distribution deserves explicit attention. Growth in volume, participation, or visibility does not automatically mean that the arrangement is sustainable for every party. Reviews should consider who receives the benefit, who absorbs coordination time, which costs are reimbursed, whether margins or workloads remain viable, and whether participants retain meaningful options. The relevant question is not whether all parties receive identical value, but whether the arrangement is transparent enough to judge trade-offs and whether weaker actors have a credible way to raise concerns. This distributional view is particularly important when the intended outcomes include trust, decision quality, and alignment.

Domain	Leading indicator	Outcome indicator	Failure signal
Values-to-decision consistency	decision-value alignment	credibility and trust	values used only as slogans
Participative sensemaking	quality of participation	better-informed decisions	consultation without influence
Capability-enabling leadership	delegated decision competence	organizational depth	leader bottlenecks
Accountability and learning	follow-up completion	adaptation and legitimacy	defensiveness and repeated errors

Table 3. Illustrative indicators and failure signals.

6. PERFORMANCE AND ACCOUNTABILITY ARCHITECTURE

6.1 Linked outcomes rather than activity counts

Measurement should be organized as a linked scorecard rather than a collection of activity counts. Activity measures remain useful for diagnosis, but they can produce misleading conclusions when separated from outcomes. The number of people trained, messages posted, partners onboarded, or transactions processed says little about quality if the organization cannot show what happened to trust, decision quality, or the burden placed on staff and partners. A linked scorecard therefore combines a small number of leading indicators, service or operating outcomes, resource measures, learning indicators, and a community-facing measure. The design principle is simple: each metric should support a decision that somebody is expected to make.

6.2 Operational and resource discipline

Process measures are strongest when their denominator is explicit. For example, success in community consultations should be defined against eligible or initiated cases rather than only against completed cases. Otherwise, people who abandon the process disappear from the measure. Financial and workload measures should also include exception handling, rework, support time, and channel-specific costs where they are material. These details matter in community organizations because hidden work is often absorbed by committed employees or partners. A strategy can look efficient while relying on unpaid coordination or repeated manual correction. Balanced performance systems were developed partly to avoid this kind of narrow optimization (Saks, 2006; Boxall & Purcell, 2016).

6.3 Learning and stakeholder outcomes

Learning measures ask whether evidence changes routines. Useful signals include the time from a recurring problem to a verified correction, the proportion of review actions that are completed, the number of repeated exceptions after a change, and whether frontline or stakeholder feedback is closed with an explained response. These measures are particularly relevant to resource trade-offs, strategy meetings, and handling of difficult feedback, where the value of information depends on follow-through. Baselines should be documented before significant changes are introduced. If prices, staffing, target groups, geography, or service promises change at the same time, later performance should not be attributed solely to the focal intervention.

Layer	Metric	Definition	Decision supported
Participation	Eligible completion rate	Completed eligible cases / initiated eligible cases	Where do people or partners drop out?
Service / process	Quality of participation	Cases meeting the stated operating rule / cases checked	Which handoff needs correction?
Capability	Decision-value alignment	Verified cases in which the intended routine is performed independently	Is capability becoming repeatable?
Resource	Exception cost and workload	Time and direct cost used for rework, support, and unresolved exceptions	Is the arrangement economically and operationally sustainable?
Learning	Issue-to-change cycle time	Median time from recurring issue to verified process change	Is evidence producing learning?
Outcome	Trust	Defined outcome measure appropriate to community-oriented social enterprises	Is the focal strategy producing its intended result?

Table 4. Minimum linked scorecard for a pilot or field study.

Measurement should begin with a baseline and a clearly stated boundary. If the organization changes prices, staffing, target groups, service channels, or partner rules at the same time, later outcomes should not be attributed to value-based leadership alone. A short narrative review of major contextual changes should accompany the scorecard so that numbers remain interpretable and hidden trade-offs are easier to detect.

7. PROPOSITIONS FOR EMPIRICAL TESTING

The framework leads to six propositions. They are stated as testable expectations rather than confirmed findings. Each proposition includes a condition that future research should measure rather than assume.

Proposition 1 - Values-to-decision consistency

Stronger values-to-decision consistency will be positively associated with trust because it helps the organization connect stated values with visible choices about people, resources, and stakeholders. The relationship should weaken when values used only as slogans, when roles are unclear, or when the cost of compliance is shifted to actors with the least capacity. Future studies can test the proposition by combining decision-value alignment with outcome measures collected over more than one review cycle.

Proposition 2 - Participative sensemaking

Stronger participative sensemaking will be positively associated with decision quality because it helps the organization bring operational and community knowledge into important decisions without avoiding managerial responsibility. The relationship should weaken when consultation without influence, when roles are unclear, or when the cost of compliance is shifted to actors with the least capacity. Future studies can test the proposition by combining quality of participation with outcome measures collected over more than one review cycle.

Proposition 3 - Capability-enabling leadership

Stronger capability-enabling leadership will be positively associated with alignment because it helps the organization delegate with support, feedback, and clear boundaries so capability grows beyond individual leaders. The relationship should weaken when leader bottlenecks, when roles are unclear, or when the cost of compliance is shifted to actors with the least capacity. Future studies can test the proposition by combining delegated decision competence with outcome measures collected over more than one review cycle.

Proposition 4 - Accountability and learning

Stronger accountability and learning will be positively associated with employee commitment because it helps the organization review consequences, explain difficult trade-offs, and correct decisions when evidence changes. The relationship should weaken when defensiveness and repeated errors, when roles are unclear, or when the cost of compliance is shifted to actors with the least capacity. Future studies can test the proposition by combining follow-up completion with outcome measures collected over more than one review cycle.

Proposition 5 - Governance quality as a moderator

Transparent rules, clear decision rights, proportionate information access, and credible grievance or review mechanisms will strengthen the relationship between value-based leadership and trust. Where governance is unilateral or opaque, activity can increase while trust, local capability, or value retention deteriorates. Governance should therefore be measured as a moderator rather than treated as an unobserved background condition.

Proposition 6 - Learning and inclusion

The expected benefits of value-based leadership will be more durable when organizations preserve assisted pathways, review who is excluded, and convert evidence from implementation into routine change. A design that improves average speed for already-capable participants may still reduce inclusion if it removes alternatives or creates barriers for lower-readiness groups. Learning and inclusion are therefore expected to shape both reach and long-term adaptability.

Proposition	Primary mechanism	Expected organizational outcome	Boundary / moderator
P1	Values-to-decision consistency	trust	values used only as slogans
P2	Participative sensemaking	decision quality	consultation without influence
P3	Capability-enabling leadership	alignment	leader bottlenecks
P4	Accountability and learning	employee commitment	defensiveness and repeated errors
P5	Governance quality	trust	role clarity, information access, grievance and exit
P6	Learning and inclusion	organizational legitimacy	readiness, alternative pathways, review discipline

Table 5. Summary of propositions and measurement direction.

A multilevel design is appropriate because process reliability can change within weeks, while trust, capability, retention, or resilience may require months to become visible. Researchers should preregister primary outcomes where feasible, document concurrent organizational changes, and avoid selecting only the indicators that improved after implementation. Qualitative evidence from users, employees, partners, and community actors can help explain why the same intervention produces different results across settings.

8. A STAGED IMPLEMENTATION PATHWAY

Resource-constrained organizations should not begin with a large technology, communication, or restructuring commitment. A staged pathway allows managers to make assumptions visible, protect scarce resources, and learn before expanding scope.

Stage	Core work	Minimum evidence before progression
1. Diagnose	Map one important problem, affected groups, responsibilities, exceptions, and current costs	Baseline; named problem owner; clear boundary
2. Standardize	Align definitions, roles, information, service rules, and escalation	Test cases reconcile; staff and partners can explain the process
3. Pilot	Apply the framework to a limited group, geography, service, or partner set	Reliable completion; transparent resource use; no unresolved critical risk
4. Learn	Review user, employee, partner, financial, and inclusion evidence	Documented corrections; unresolved risks assigned
5. Scale	Expand only elements that remain reliable, affordable, and beneficial	Capacity, governance, support, privacy, and monitoring controls ready

Table 6. Five-stage implementation pathway.

8.1 Choosing a manageable pilot

A useful pilot begins with a visible problem, a bounded group, and evidence that can be collected without excessive burden. In this domain, a pilot might focus on delegation decisions, one service or product category, one partner cluster, or a recurring exception such as community consultations. The scope should state what will not be attempted. A small pilot is valuable because it exposes assumptions about roles, information, workload, and stakeholder response before the organization commits scarce resources at scale.

8.2 Governance before expansion

Before expansion, participants should agree on ownership of records, decision authority, service or quality rules, financial responsibilities, communication, privacy, complaint escalation, and exit. The rules need to be understandable to the people expected to use them. If a central operator can change access conditions, fees, rankings, or service requirements, the process and notice period should be explicit. Governance does not eliminate disagreement, but it prevents ordinary disagreements from becoming avoidable uncertainty.

8.3 Capability building through operating work

Training is most useful when attached to recurring work. People can learn through completing performance conversations, reviewing an exception, explaining a decision, or interpreting a scorecard. Coaching should gradually reduce dependency rather than create a permanent need for external assistance. Completion certificates or attendance records are weak evidence on their own. The stronger test is whether participants can execute the task, diagnose a problem, and make a justified improvement using the available information (Gronroos, 1984).

8.4 Scale, redesign, pause, or discontinue

At each review gate, management should make an explicit decision: scale, redesign, pause, or discontinue. Scale is justified only when reliability, workload, resource economics, stakeholder participation, and governance controls meet stated thresholds. Redesign is appropriate when handling of difficult feedback generates repeated exceptions or when the intended beneficiaries remain peripheral to the process. A pause can protect users and the organization when data integrity, safety, or capacity is uncertain. Discontinuation can also be responsible when a model cannot meet its promises at acceptable cost and risk.

For smaller organizations, the review rhythm can remain simple: a short operational review each week or month, a periodic partner or stakeholder scorecard, and a more deliberate governance review before major expansion. The discipline of closing actions and revisiting assumptions is more important than dashboard sophistication.

9. DISCUSSION

9.1 Theoretical implications

The framework reframes value-based leadership as an organizational capability rather than a stand-alone initiative. Its contribution arises from the coordination of values-to-decision consistency, participative sensemaking, capability-enabling leadership, and accountability and learning. This helps explain why the same visible practice can produce different results across organizations. Technology, communication, training, or partnership arrangements are inputs. They become consequential only when responsibilities, information, incentives, and follow-up are connected well enough to support repeatable decisions. The finding is conceptual rather than empirical, but it offers a clearer set of mechanisms for later testing (Ostrom, 1990; Sen, 1999).

9.2 Managerial implications

The theoretical implication is that the dependent variable should be broader than adoption or output. Outcomes such as trust, decision quality, and alignment need to be considered alongside process quality, local capability, and distributional effects. The framework also treats governance as a moderator. Similar resources can produce different results when one arrangement gives participants usable information and voice while another concentrates decisions and leaves weaker actors to absorb uncertainty. This view is compatible with stakeholder and capability perspectives, which emphasize both relationships and the organization of action (Saks, 2006; Gronroos, 1984).

9.3 Implications for community and partner institutions

For managers, the most useful starting exercise is to map one complete case from the first signal to the final response. The map should show who receives information, who makes a decision, who performs the work, where exceptions are recorded, and what the user or stakeholder sees. Breaks in this sequence usually point to a more specific problem than a general call for 'better strategy.' If information is reliable but action is slow, decision rights may be the bottleneck. If activity is high but complaints repeat, the issue may be learning. If outcomes improve while partner burden rises, the economics and governance of the arrangement need review.

9.4 Limitations and research agenda

Several limitations remain. This article is a conceptual synthesis and does not estimate causal effects. The framework may require adjustment across sectors, organizational forms, regions, and levels of resource availability. Constructs such as trust, participation, capability, and resilience also develop over different time horizons. Future research could combine longitudinal administrative data with interviews, process observation, and stakeholder panels; compare alternative governance arrangements; and test whether early indicators predict later outcomes. Researchers should also report who benefits and who bears cost, because average improvement can conceal exclusion or dependency.

9.5 Research design implications

Future empirical work can use phased implementation, matched cases, longitudinal panels, or mixed methods depending on data access and the maturity of the intervention. The strongest designs will distinguish inputs, operating mechanisms, intermediate learning outcomes, and final outcomes rather than collapsing them into a single success measure. Reporting negative or null results is equally important because it clarifies which conditions limit the usefulness of value-based leadership.

9.6 Measurement and institutional implications

Institutions that fund, regulate, or support community-facing organizations should avoid rewarding activity counts alone. Evaluation is stronger when it asks whether the operating mechanism is reliable, whether stakeholders can understand and question the arrangement, and whether the organization can show how evidence changed a decision. These questions are especially important where public legitimacy or community benefit is part of the stated purpose. They also make comparison across cases more meaningful because the analysis is based on process quality as well as headline output.

For practitioners, the framework can be used as a periodic diagnostic rather than a one-time audit. A review can begin with the four mechanisms, identify the weakest handoff, assign one correction, and then examine whether the change improves both operating performance and stakeholder experience. This rhythm keeps improvement close to day-to-day work and reduces the temptation to respond to every problem with a new program, platform, or policy.

10. CONCLUSION

Value-Based Leadership in Community-Oriented Social Enterprises is best understood as a problem of coordinated capability. The focal strategy becomes credible when organizations can connect values-to-decision consistency, participative sensemaking, capability-enabling leadership, and accountability and learning to decisions that people can observe and review. Under those conditions, the strategy has a plausible pathway toward trust, decision quality, and alignment. Without them, visible activity can expand while the underlying service, relationship, or capability remains fragile.

The practical starting point is deliberately modest: one important problem, one clearly defined group, a baseline, named responsibilities, and a small number of indicators that support real decisions. Managers can then standardize what needs consistency, preserve judgment where cases differ, learn from exceptions, and scale only what remains reliable and fair. The framework and propositions developed here are intended to make that process testable. They do not replace empirical evidence, but they give future studies and organizational pilots a disciplined way to ask what changed, for whom, through which mechanism, and under what conditions.
